Numbers reflect as treated results, defined as subjects with diary data at baseline and 6 months (p=0.002). Intent to treat results, which include all randomized subjects, are 61% for Sacral Neuromodulation (SNM) and 42% for standard medical therapy (SMT) (p=0.03).

*anticholinergic/antimuscarinic

Device-related adverse events occurred in 31% of SNM patients, and medication-related adverse events occurred in 27% of SMT patients.

DEMONSTRATES SUSTAINED EFFICACY AT 12 MONTHS

85% of SNM Patients Achieved Clinical Success†3

Clinical success defined as 50% improvement from baseline.

† Numbers reflect completers analysis. Modified completers analysis which includes subjects who either had a baseline and 12-month evaluation, or withdrew early due to device-related reasons and considered failures, are 82% at 12 months.

Device-related adverse events occurred in 30% of subjects post-implant. The most common device-related AEs were undesirable change in stimulation, implant site pain, and implant site infection.
